Notes to user:

THESE MAPS ARE FOR ADVISORY PURPOSES ONLY. The elevations are based on approximate 1% Annual Chance flood elevation and overland wave effects.

To compute estimated flood elevation for a specific site, apply the following formula:

Estimated 1% annual chance flood elevation = surge + waves
= 18 Feet + (18 - Grade)/2

Where Grade = Lowest ground elevation at the site

Please refer to Draft Report titled "Preliminary Mississippi Flood Frequency Analysis for Hurricane Katrina" for supporting technical documentation for the information shown on this map.

All elevations are in reference to NAVD88

SCALE = 1" = 4000'
